Universal Grammar: Principles & Parameters

Principles: Apply to all human languages.
Ex: Language has hierarchical structure.
Smaller units are chunked into larger units.

Universal Grammar: Principles & Parameters

Parameters: Constrained variation across languages. Children must learn which option their native language uses.

Japanese/Navajo

Basic word order:
Subject Object Verb

Postpositions:
Noun Phrase Postposition

Possessor before Possessed
Possessor Possession

Universal Grammar: Principles & Parameters

Parameters: Constrained variation across languages. Children must learn which option their native language uses.

Edo/English

Basic word order:
Subject Verb Object

Prepositions:
Preposition Noun Phrase

Possessed before Possessor
Possession Possessor

Universal Grammar: Principles & Parameters

At this level of structural analysis (parameters), languages differ very minimally from each other. This makes language structure much easier for children to learn. All they need to do is set the right parameters for their language, based on the data that are easy to observe.

Japanese/Navajo

Edo/English

Language Variation: Summary

While languages may differ on many levels, they have many similarities at the level of language structure (syntax). Even languages with no shared history seem to share similar structural patterns.

One way for children to learn the complex structures of their language is to have them already be aware of the ways in which human languages can vary. Nativists believe this is knowledge contained in Universal Grammar. Then, children listen to their native language data to decide which patterns their native language follows.

Languages can be thought to vary structurally on a number of linguistic parameters. One purpose of parameters is to explain how children learn some hard-to-notice structural properties.

But what are linguistic parameters really? How do they work?
What exactly are they supposed to do?

Parameters

A parameter is meant to be something that can account for multiple observations in some domain.

Parameter for a statistical model: determines what the model expects to observe in the world in a variety of situations

Parameter for our minds (and language): determines what we expect to observe in the world in a variety of situations

Statistical Parameters

The normal distribution is a statistical model that uses two parameters:

- μ for the mean
- σ for the standard deviation

If we know the values of these parameters, we can make predictions about the likelihood of data we rarely or never see.

Statistical Parameters

Suppose this is a model of how many minutes late you'll be to class. Let's use the model with $\mu = 0$, and $\sigma^2 = 0.2$. (blue line)

Statistical Parameters

Suppose this is a model of how many minutes late you'll be to class. Let's use the model with $\mu = 0$, and $\sigma^2 = 0.2$. (blue line)

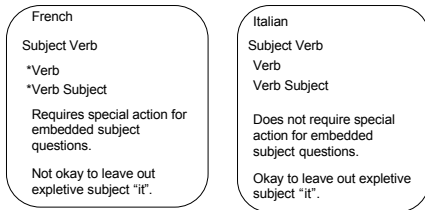

How likely are you to be 5 minutes late, given these parameters?

Not very likely! We can tell this just by knowing the values of the two statistical parameters. These parameter values allow us to infer the likelihood of some observed behavior.

Linguistic Parameters

Under the nativist perspective, a linguistic parameter is an innate, language-specific abstraction that connects to many structural properties about language.

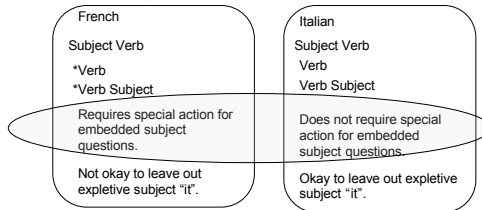

Example from last time: the "subject" parameter

Linguistic Parameters: Useful

This is useful for acquisition because a child can learn a parameter's value by observing many different examples and many different structures.

This can be helpful for hard-to-learn structures.

Why Hard-To-Learn Structures Are Easier

Let's label these structural properties.

Why Hard-To-Learn Structures Are Easier

Let's assume they are all connected to parameter P, which can take one of two values: a or b.

Why Hard-To-Learn Structures Are Easier

How do we learn whether P4 shows behavior a or b?
One way is to observe many instances of P4.

Why Hard-To-Learn Structures Are Easier

But what if P4 occurs very rarely? We might never see any examples of P4.

Why Hard-To-Learn Structures Are Easier

Fortunately, if P4 is connected to P, we can learn the value for P4 by learning the value of P. Also fortunately, P is connected to P1, P2, P3, and P5.

Why Hard-To-Learn Structures Are Easier

Step 1: Observe P1, P2, P3, or P5. In this case, all the observed examples of these structures are behavior a.

Why Hard-To-Learn Structures Are Easier

Step 2: Use this knowledge to set the value of parameter P to a.

Why Hard-To-Learn Structures Are Easier

Step 3: Since parameter P is connected to P4, we can predict that P4 will also show behavior a - even though we've never seen any examples of it! (We can also infer P3 and P5 the same way.)

Why Acquisition Is Easier

This highlights another benefit of parameters - we don't have to learn the behavior of each structure individually. Instead, we can observe some structures (ex: P1 and P2) and infer the right behavior for the remaining structures (P3, P4, and P5).

That is, instead of having to make 5 decisions (one for P1, P2, P3, P4, and P5), we actually only need to make one decision - is P a or b?

What are some real parameters?

Morphology: the Compounding parameter (Snyder 1995, 2001, 2002)

English is +compounding:

"banana box" = box that holds bananas

Spanish is -compounding:

* "caja banana", "banana caja" ≠ box that holds bananas

What are some real parameters?

Morphology: the Compounding parameter (Snyder 1995, 2001, 2002)

- connected property: transitive resultative

English allows transitive resultative constructions:

John beat the iron flat.

Spanish does not allow transitive resultative constructions:

Juan golpeó el hierro (*plano).

John beat the iron *flat*

What are some real parameters?

Morphology: the Compounding parameter (Snyder 1995, 2001, 2002)

- connected property: transitive resultative
- connected property: separable particle

English allows separable particle constructions:

Mary lifted the box up.

Spanish does not allow separable particle constructions:

María levantó la caja (*arriba).

Mary lifted the box *up*

What are some real parameters?

Syntax: the Head Directionality parameter (Baker 2001, Cook & Newson 1996): heads of phrases (ex: Nouns of Noun Phrases, Verbs of Verb Phrases, Prepositions of Preposition Phrases) are consistently in either the leftmost or rightmost position

Japanese/Navajo: Head-Last

Verb Phrase:
Object Verb

Postpositions:
Noun Phrase Postposition

What are some real parameters?

Syntax: the Head Directionality parameter (Baker 2001, Cook & Newson 1996): heads of phrases (ex: Nouns of Noun Phrases, Verbs of Verb Phrases, Prepositions of Preposition Phrases) are consistently in either the leftmost or rightmost position

Edo/English: Head-First

Verb Phrase:
Verb Object

Prepositions:
Preposition Noun Phrase

Remaining problems even if we have parameters

The observable data are often the result of a combination of parameters. That is, the observable data are the result of some unobservable process, and the child has to reverse engineer the observable data to figure out what parameter values might have produced the observable data - even if the child already knows what the parameters are!

An example of the problem: metrical phonology

Metrical phonology:
What tells you to put the EMphasis on a particular SYLLable

Process speakers use:
Basic input unit: syllables

em pha sis

Larger units formed: metrical feet

The way these are formed varies from language to language. Only syllables in metrical feet can be stressed.

(em pha) sis

Stress assigned within metrical feet

The way this is done also varies from language to language.

(EM pha) sis

Observable Data: stress contour of word EMphasis

An example of the problem: metrical phonology

Metrical phonology system here: 5 main parameters, 4 sub-parameters
(adapted from Dresher 1999 and Hayes 1995)

All combine to generate stress contour output

Summary: Linguistic Parameters

Linguistic parameters are similar to statistical parameters in that they are abstractions about the observable data. For linguistic parameters, the observable data are language data.

Parameters make acquisition easier because hard-to-learn structures can be learned by observing easy-to-learn structures that are connected to the same parameters.

Still, even with parameters, acquisition can be hard because a child has to figure out which parameter values produce the observable data, which isn't always easy.
